

White Paper on “**Geospatial MRV Frameworks for Climate-Smart Agriculture
and Carbon Markets**”

Client: ABC GreenCarbon Exchange Pvt Ltd.

Project Location: Maharashtra, India (Semi-urban)

Lead Consultant: Mr. XYZ, ESG & MRV Lead

Date of Submission: [xx/xx/xxxx]

Background: ABC GreenCarbon Exchange need a technical white paper to explain MRV (Measurement, Reporting & Verification) using geospatial technologies for carbon credits, regenerative agriculture, ESG reporting, etc. Target Audience: Impact investors, ESG auditors, Climate funds, Corporate sustainability teams.

Prepared by: Temkars Agri-Tech & Geospatial Consultancy, Pune

All locations, financial figures, stakeholder names, and survey data contained herein are fictitious or anonymized for illustration. An actual engagement with Temkars results in a fully customized report based on site-specific information and your unique project requirements.

Note: Images are for representation only. Actual analysis and final outputs contain detailed, project-specific data, high-precision GIS mapping, and proprietary client analytics.

“Scaling High-Integrity Carbon Markets: A Geospatial Framework for Digital MRV (dMRV) in Agriculture.”

1.0 Executive Summary	4
1.1 The Trust Crisis	4
1.2 The Scalability Bottleneck	4
1.3 The Geospatial Solution: Digital MRV (dMRV)	4
1.4 Strategic Impact	5
2.0 Evolution of MRV (Measurement, Reporting, Verification)	6
2.1 Traditional vs. Digital MRV	6
2.1.1 Traditional MRV	6
2.1.2 Digital MRV (dMRV)	7
2.2 The Economic Case for Digital MRV	8
2.3 Strategic Implications	9
3.0 Technical Methodology: Remote Sensing for Biomass & Carbon	10
3.1 Above-Ground Biomass (AGB) Estimation	10
3.1.1 Optical Satellite Data	10
3.1.2 Synthetic Aperture Radar (SAR)	10
3.2 Soil Organic Carbon (SOC) Proxies	11
3.2.1 Proxy Approaches	11
3.3 Establishing the Baseline (Additionality)	11
3.3.1 Historical Time-Series Analysis	11
3.3.2 Spatial Stratification	12
3.4 Integrated Workflow for MRV	12
4.0 GIS Frameworks for Project Monitoring	14
4.1 Polygon Management & Stratification	14
4.1.1 Defining Project Boundaries	14
4.1.2 Stratification for Homogeneous Zones	14
4.2 Data Fusion	15
4.3 Anomaly Detection	15
4.4 Integrated GIS Monitoring Workflow	16
5.0 Verification, Compliance & International Standards	17
5.1 Alignment with Verra (VM0042) & Gold Standard	17
5.1.1 Verra VM0042 (Agriculture and Land-Use Projects)	17
5.1.2 Gold Standard AFOLU Requirements	17
5.2 The Audit Trail	18
5.3 Handling Uncertainty	18

5.3.1 Sources of Uncertainty.....	18
5.3.2 Statistical Approaches.....	18
5.4 Key Benefits of Geospatial MRV for Compliance.....	19
6.0 Case Applications.....	20
6.1 Scenario A: Regenerative Cotton Landscape.....	20
6.2 Scenario B: Mangrove Restoration (Blue Carbon).....	21
6.3 Comparative Summary	22
7.0 Future Trends: AI & Blockchain Integration	24
7.1 Machine Learning Classifiers for Carbon Estimation.....	24
7.1.1 Moving Beyond Simple Indices.....	24
7.2 On-Chain Carbon Credits.....	25
7.3 Benefits of AI & Blockchain Integration	25
7.4 Predictive Analytics for Climate Finance	25
8.0 Conclusion	27
8.1 The Path Forward.....	27
8.2 The Temkars Edge.....	27
9.0 Appendices.....	29
9.1 Glossary of Terms	29
9.2 Technical Specifications.....	29
9.3 Baseline & Additionality Reference Table.....	30
9.4 MRV Workflow Summary Table.....	30
References.....	31

1.0 Executive Summary

1.1 The Trust Crisis

Voluntary Carbon Markets (VCM) are expanding rapidly, yet skepticism persists regarding the integrity of issued carbon credits. Investors, ESG auditors, and corporate sustainability teams often question whether reported sequestration is real, additional, and verifiable. The term "phantom credits" has emerged to describe credits that are claimed but not demonstrably captured, undermining confidence in climate finance (Hamilton et al., 2021).

Agricultural carbon projects face specific challenges: heterogeneous land management, inconsistent record-keeping, and variable carbon sequestration rates. Traditional MRV approaches relying on manual soil sampling and sporadic audits struggle to provide high-resolution, auditable evidence, creating both financial and reputational risk for stakeholders.

1.2 The Scalability Bottleneck

Manual MRV systems are not scalable. Consider the following constraints:

Constraint	Impact
Labor-intensive soil sampling	High operational costs (30–40% of credit revenue)
Sparse spatial coverage	Missed sequestration variability, potential overestimation
Time-to-audit	Delays credit issuance, reducing project liquidity
Data inconsistencies	Increased risk of investor disputes and regulatory scrutiny

These bottlenecks limit the ability of projects to scale, particularly for Nature-Based Solutions (NbS) where interventions span thousands of hectares and require frequent monitoring for additionality and compliance (Verra, 2021).

1.3 The Geospatial Solution: Digital MRV (dMRV)

Digital MRV, or dMRV, leverages satellite-based remote sensing, GIS analytics, and IoT data to create continuous, auditable, and high-resolution monitoring systems. Key capabilities include:

- Complete spatial coverage: Every hectare can be observed and monitored, reducing sampling uncertainty.
- Time-series tracking: Historical and current data validate additionality and permanence.
- Immutable digital records: GIS dashboards and cloud storage create tamper-proof audit trails.
- Cost reduction: Remote sensing reduces reliance on extensive field campaigns, lowering verification expenses by up to 40% (Gold Standard, 2020).

Figure 1: Conceptual Digital MRV Workflow – From Field to Audit

This approach directly addresses investor concerns, demonstrating credible carbon capture while enabling scalable deployment across diverse agroecosystems.

1.4 Strategic Impact

The dMRV framework aligns with global climate governance and corporate sustainability priorities:

- Article 6 of the Paris Agreement: Supports internationally transferred mitigation outcomes (ITMOs) by providing verifiable carbon accounting at project scale (UNFCCC, 2021).
- Corporate Net-Zero Goals: Offers standardized reporting that satisfies internal ESG frameworks and external auditors.
- Market Liquidity: Accelerates "time-to-issuance" for carbon credits, improving market confidence and enabling faster capitalization of Nature-Based Solutions projects.

Strategic Objective	Geospatial MRV Contribution
Investor Confidence	Transparent, high-resolution monitoring reduces risk of phantom credits
Cost Efficiency	Remote sensing and GIS reduce verification costs and personnel burden
Regulatory Compliance	Aligns with Verra, Gold Standard, and ISO 14064-2 standards
Market Scalability	Enables large-area monitoring, supporting portfolio-level carbon finance

2.0 Evolution of MRV (Measurement, Reporting, Verification)

2.1 Traditional vs. Digital MRV

2.1.1 Traditional MRV
